CAMBRIDGE INTERNATIONAL EXAMINATIONS

Cambridge International Advanced Subsidiary and Advanced Level

MARK SCHEME for the October/November 2014 series

9702 PHYSICS

9702/41

Paper 4 (A2 Structured Questions), maximum raw mark 100

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge will not enter into discussions about these mark schemes.

Cambridge is publishing the mark schemes for the October/November 2014 series for most Cambridge IGCSE[®], Cambridge International A and AS Level components and some Cambridge O Level components.

Page 2	Mark Scheme	Syllabus	Paper
	Cambridge International AS/A Level – October/November 2014	9702	41

Section A

1 (a)
$$g = GM/R^2$$
 C1
= $(6.67 \times 10^{-11} \times 6.4 \times 10^{23})/(3.4 \times 10^6)^2 = 3.7 \,\text{N kg}^{-1}$ A1 [2]

(b)
$$\Delta E_{\rm P} = mg\Delta h$$

because $\Delta h \ll R$ (or 1800 m $\ll 3.4 \times 10^6$ m) g is constant B1
 $\Delta E_{\rm P} = 2.4 \times 3.7 \times 1800$ C1
 $= 1.6 \times 10^4$ J A1 [3]
(use of $g = 9.8 \, m \, s^{-2}$ max. 1 for explanation)

(c) gravitational potential energy =
$$(-)GMm/x$$
 C1
 $v^2 = 2GM/x$ C1
 $x = 4D = 4 \times 6.8 \times 10^6$ C1

$$v^2 = (2 \times 6.67 \times 10^{-11} \times 6.4 \times 10^{23})/(4 \times 6.8 \times 10^6)$$

= 3.14 × 10⁶
 $v = 1.8 \times 10^3 \,\mathrm{m \, s^{-1}}$ A1 [4]
(use of 3.5D giving 1.9 × 10³ m s⁻¹, allow max. 3)

2 (a) (i)
$$F = R \cos \theta$$
 M1
 $W = R \sin \theta$ M1
dividing, $W = F \tan \theta$ A0 [2]
(max. 1 if derivation to final line not shown)

(b) either
$$F = mv^2/r$$
 and $W = mg$
or $v^2 = rg/\tan \theta$ C1
 $v^2 = (14 \times 10^{-2} \times 9.8)/\tan 28^\circ$ C1
 $= 2.58$
 $v = 1.6 \,\mathrm{m \, s}^{-1}$ A1 [3]

3 (a) obeys the equation
$$pV/T$$
 = constant (accept $pV = nRT$) B1 [1]

(b) (i)
$$pV = nRT$$
 C1
 $5.0 \times 10^7 \times 3.0 \times 10^{-4} = n \times 8.31 \times 296$ giving $n = 6.1$ mol A1 [2]

(ii) pressure
$$\infty$$
 amount of substance
loss = 0.40/100 × 6.1 mol = 0.0244 mol
= 0.0244 × 6.02 × 10²³ (atoms) C1
= 1.47 × 10²² atoms C1

rate =
$$(1.47 \times 10^{22})/(35 \times 24 \times 60 \times 60)$$

= $4.9 \times 10^{15} \,\text{s}^{-1}$ A1 [4]

		Cambridge International AS/A Level – October/November 2014 9702	41	
4	(a)	acceleration / force proportional to displacement (from a fixed point) either acceleration and displacement in opposite directions	M1	
		or acceleration always directed towards a fixed point	A1	[2]
	(b)	(i) <i>g</i> and <i>r</i> are constant so <i>a</i> is proportional to <i>x</i> negative sign shows <i>a</i> and <i>x</i> are in opposite directions	B1 B1	[2]
		(ii) $\omega^2 = g/r \text{ and } \omega = 2\pi/T$ $\omega^2 = 9.8/0.28$	C1	
		= 35	C1	
		$T=2\pi/\sqrt{35}=1.06\mathrm{s}$ time interval $\tau=0.53\mathrm{s}$	A1	[3]
	(c)	sketch: time period constant (or increases very slightly) drawn line always 'inside' given loops	M1 A1	
		successive decrease in peak height	A1	[3]
5	(a)	work done in moving unit positive charge from infinity (to the point)	M1 A1	[2]
	(b)	(i) inside the sphere, the potential would be constant	B1	[1]
		(ii) for point charge, Vx is constant co-ordinates clear and determines two values of Vx at least 4 cm apart conclusion made clear	B1 M1 A1	[3]
	(c)	$q = 4\pi \varepsilon_0 Vx$	• • •	
		$q = 4\pi \times 8.85 \times 10^{-12} \times 180 \times 1.0 \times 10^{-2}$ $= 2.0 \times 10^{-10} \mathrm{C}$	M1 A1	[2]
6	(a)	$F = BIL \sin \theta$ = 2.6 \times 10^{-3} \times 5.4 \times 4.7 \times 10^{-2} \times \sin 34^\circ	C1	
		$= 3.69 \times 10^{-4} \text{ N}$ (allow 1 mark for use of cos 34°)	A1	[2]
	(b)	peak current = $1.7 \times \sqrt{2}$ = 2.4 A	C1	
		max. force = $2.6 \times 10^{-3} \times 2.4 \times 4.7 \times 10^{-2} \times \sin 34^{\circ}$ = $1.64 \times 10^{-4} \text{N}$	C1	
		variation = $2 \times 1.64 \times 10^{-4}$ = 3.3×10^{-4} N	A1	[3]

		(Cambridge International AS/A Level – October/November 2014	9702	41	
7	(a)	(i)	either heating effect in a resistor ∞ (current) ² square of value of an alternating current is always positive so heating effect or current moves in opposite directions in resistor during half-cycles heating effect is independent of direction	S	B1 B1 A0 (B1) (B1)	[2]
		(ii)	that value of the direct current producing the same heating effect (as the alternating current) in a r	esistor	M1 A1	[2]
	(b)	(i)	induced e.m.f. proportional to the rate of change of (magnetic) flux (linkage)		M1 A1	[2]
		(ii)	flux in core is in phase with current in the primary coil (induced) e.m.f. in secondary because coil cuts the flux flux and rate of change of flux are not in phase		B1 B1 B1	[3]
8	(a)	pho	oton 'absorbed' by electron oton has energy equal to difference in energy of two energy levels ctron de-excites emitting photon (of same energy) in any direction		B1 B1 B1	[3]
	(b)	(i)	$E = hc/\lambda$ = $(6.63 \times 10^{-34} \times 3 \times 10^{8})/(435 \times 10^{-9})$ = 4.57×10^{-19} J (allow 2 s.f.) = $(4.57 \times 10^{-19})/(1.6 \times 10^{-19})$ (eV) = 2.86 eV (allow 2 s.f.)		C1 C1 C1	[4]
		(ii)	arrow pointing in either direction between -3.41 eV and -0.55 eV		B1	[1]
9	(a)	ʻligl	nt' nuclei combine to form 'heavier' nuclei		B1	[1]
	(b)	(i)	either energy = $c^2 \Delta m$ or energy = $(3.00 \times 10^8)^2 \times 1.66 \times 10^{-27}$ energy = $1.494 \times 10^{-10} \text{ J}$ = $(1.494 \times 10^{-10})/(1.60 \times 10^{-13})$ = $934 \text{ MeV } (3 \text{ s.f.})$		C1 C1	[3]
		(ii)	$\Delta m = (2.01356 + 3.01551) - (4.00151 + 1.00867)$ = 5.02907 - 5.01018 = 0.01889 u		C1	
			energy = 0.01889 × 934 = 17.6 MeV (allow 2 s.f.)		A1	[2]
	1	(iii)	high temperature means high speeds/kinetic energy of nuclei D and T nuclei collide despite repelling one another		B1 B1	[2]
