COMPUTER SCIENCE **9608/33**

Paper 3 Advanced Theory **October/November 2017**

1 hour 30 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

No calculators allowed.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name in the spaces at the top of this page.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams, graphs or rough working.
Do not use staples, paper clips, glue or correction fluid.
DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions.
No marks will be awarded for using brand names of software packages or hardware.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.

The maximum number of marks is 75.

This document consists of **16** printed pages.

[Turn over

1 A Local Area Network (LAN) consists of three computers, one server and a switch. The LAN uses a star topology.

(a) Complete the following diagram to show how the computers, the server and the switch could be connected.

Switch	⇄	Server	Computer A	Computer B	Computer C

[1]

(b) There are four statements in the following table. For each statement, place a tick (✓) in the appropriate column to indicate whether it is true or false.

Statement	True	False
The server can send packets to Computer B and Computer C at the same time.		
The network software on each computer needs to include collision detection and avoidance.		
Computer B can read a packet sent from the server to Computer C.		
Computer A can send a packet to Computer B and at the same time the server can be sending a packet to Computer C.		

[4]

(c) The LAN shown in **part (a)** will be connected to the Internet.

(i) A router will be attached to one of the devices on the LAN.

State the device used. Give a reason for your choice.

Device ....

Reason ....

....

.... [2]

(ii) Explain why a router is required.

....[.4]

....

....

.... [2]

(iii) After the router has been connected, Computer A sends several packets to an internet web server.

Explain how the packets are transmitted from the router to the web server.

....

....

....

....

....

.... [3]

2 **(a)** The following diagram shows four descriptions and four types of computer architecture.

Draw lines to connect each description to the appropriate computer architecture.

Description	**Computer architecture**
Most parallel computer systems use this architecture.	SIMD
Widely used to process 3D graphics in video games.	MIMD
A microprocessor is used to control a washing machine.	MISD
There are a number of processing units. Each processing unit executes the same instruction but on different data.	SISD

[4]

(b) A computer has a single processor that contains four processing units.

Explain why this is **not** an example of a massively parallel computer.

....

....

....

.... [2]

(c) An application has previously executed on a single computer. The application will be transferred onto a massively parallel computer.

The program code used in the application will need to be updated to ensure that the power of the massively parallel computer is fully used.

Explain what changes will be required to the program code.

....

....

....

.... [2]

(d) Explain **one** of the hardware issues that will have to be overcome if a massively parallel computer is to function successfully.

....

....

....

.... [2]

3 The following syntax diagrams for a particular programming language show the syntax of:

- an assignment statement
- a variable
- an unsigned integer
- a letter
- an operator
- a digit.

Assignment statement

Variable

Unsigned integer

Letter   **Operator**

Digit
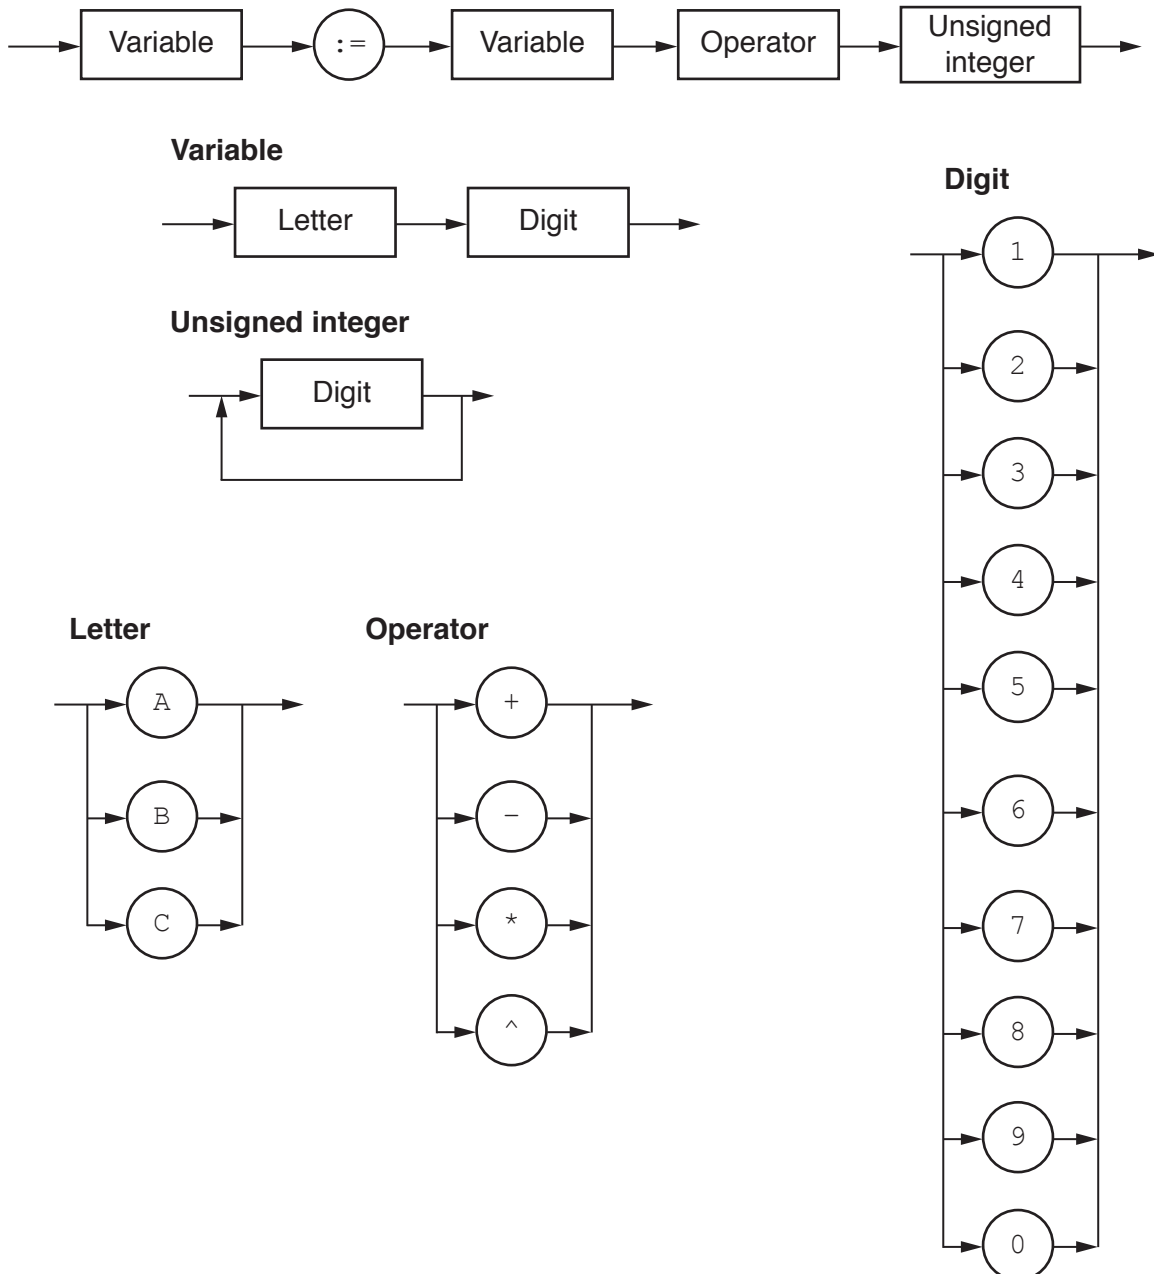

(a) The following assignment statements are invalid.

Give the reason in each case.

(i) `C2 = C3 + 123`

Reason: ....

.... [1]

(ii) `A3 := B1 – B2`

Reason: ....

.... [1]

(iii) `A32 := A2 * 7`

Reason: ....

.... [1]

(b) Complete the Backus-Naur Form (BNF) for the syntax diagrams shown.

`<digit>` has been done for you.

`<assignment_statement> ::=`

....

`<variable> ::=`

....

`<unsigned_integer> ::=`

....

`<digit> ::= 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0`

`<letter> ::=`

....

`<operator> ::=`

....

[6]

(c) The definition of `<variable>` is changed to allow:

- one or two letters and
- zero, one or two digits.

Draw an updated version of the syntax diagram for `<variable>`.

Variable

[2]

(d) The definition of `<assignment_statement>` is altered so that its syntax has `<unsigned_integer>` replaced by `<real>`.

A real is defined to be:

- at least one digit before a decimal point
- a decimal point
- at least one digit after a decimal point.

Give the BNF for the revised `<assignment_statement>` and `<real>`.

`<assignment_statement> ::= ....................................................................................`

....

`<real> ::= ....................................................................................................`

....

[2]

4 The Secure Socket Layer (SSL) protocol and its successor, the Transport Layer Security (TLS) protocol, are used in Internet communications between clients and servers.

(a) (i) Define the term **protocol**.

....

....

....

.... [2]

   (ii) Explain the purpose of the TLS protocol.

   ....

   ....

   ....

   ....

   ....

   .... [3]

(b) A handshake process has to take place before any exchange of data using the TLS protocol. The handshake process establishes details about how the exchange of data will occur. Digital certificates and keys are used.

   The handshake process starts with:

   - the client sending some communication data to the server
   - the client asking the server to identify itself
   - the server sending its digital certificate including the public key.

   Describe, in outline, the other steps in the handshake process.

   ....

   ....

   ....

   ....

   ....

   .... [3]

(c) Give **two** applications where it would be appropriate to use the TLS protocol.

   1 ....

   ....

   2 ....

   ....
   [2]

5 **(a)** **(i)** Complete the truth table for this 2-input NAND gate:
A	B	X
0	0	
0	1	
1	0	
1	1	

[1]

(ii) Complete the truth table for this 3-input NAND gate:

A	B	C	X
0	0	0	
0	0	1	
0	1	0	
0	1	1	
1	0	0	
1	0	1	
1	1	0	
1	1	1	

[1]

(b) A SR flip-flop is constructed using two NAND gates.
(i) Complete the truth table for the SR flip-flop:

	S	R	Q	$\overline{Q}$
Initially	1	0	0	1
R changed to 1	1	1		
S changed to 0	0	1		
S changed to 1	1	1		
S and R changed to 0	0	0	1	1

[3]

 [Turn over

(ii) The final row in the table in **part b(i)** shows that the output for both **Q** and $\overline{\textbf{Q}}$ is 1.

Explain why this is a problem.

....

....

....

.... [2]

(c) Another type of flip-flop is the JK flip-flop.

A JK flip-flop is constructed as follows:
(i) Complete this truth table for the JK flip-flop.

J	K	Clock	Working space	Initial values		Final values	
				Q	$\overline{Q}$	Q	$\overline{Q}$
0	0	1		1	0	1	0
0	0	1		0	1	0	1
0	1	1		1	0	0	1
0	1	1		0	1	0	1
1	0	1		1	0		
1	0	1		0	1		
1	1	1		1	0		
1	1	1		0	1		

[4]

(ii) Explain why the JK flip-flop is an improvement on the SR flip-flop.

....

....

....

.... [2]

(d) Explain the role of flip-flops in a computer.

....

....

....

.... [2]

6 A large warehouse stores goods that must be kept above a temperature of 15 degrees Celsius. The warehouse has six temperature sensors which are each placed at a different location in the warehouse.

A computer system is programmed to turn on appropriate heaters when one of the sensors is below the minimum temperature.

(a) (i) State the name given to the type of system described.

.... [1]

(ii) Justify your answer to **part (i)**.

....

.... [1]

(b) Sensors and heaters are two types of device used in this system.

State **two** other devices that are used. Justify your choice.

Device 1 ....

Justification ....

....

Device 2 ....

Justification ....

....
[4]

(c) The computer system stores the temperature readings for the six sensors in six 8-bit memory locations.

Six of the bits in an 8-bit register, `LOWREG`, are used to indicate whether a particular reading is below the minimum temperature. A value of `1` means the reading is below the minimum temperature.

For example:

This pattern of bits in `LOWREG` shows that sensor 5, sensor 4 and sensor 1 have readings below the minimum temperature.

		6	5	4	3	2	1
Not used	Not used	0	1	1	0	0	1

The following table shows part of the instruction set for a processor which has one general purpose register, the Accumulator (ACC), and an Index Register (IX).

Instruction		Explanation
Op code	**Operand**	
LDD	\<address\>	Direct addressing. Load the contents of the given address to ACC.
LDR	#n	Immediate addressing. Load the number n to IX.
LDX	\<address\>	Indexed addressing. Form the address from \<address\> + the contents of the index register. Copy the contents of this calculated address to ACC.
STO	\<address\>	Store the contents of ACC at the given address.
INC	\<register\>	Add 1 to the contents of the register (ACC or IX).
ADD	\<address\>	Add the contents of the given address to the ACC.
OR	\<address\>	Bitwise OR operation of the contents of ACC with the contents of address.
CMP	#n	Compare the contents of ACC with number n.
CMP	\<address\>	Compare the contents of ACC with the contents of \<address\>.
JMP	\<address\>	Jump to the given address.
JPE	\<address\>	Following a compare instruction, jump to \<address\> if the compare was True.
JGE	\<address\>	Following a compare instruction, jump to \<address\> if the content of ACC is greater than or equal to the number used in the compare instruction.

Question 6(c) continues on the next page.

Part of the assembly language code for updating LOWREG is:

Label	Op code	Operand
LOWTEMP:		15
LOWREG:		B00000000
COUNTER:		1
START:	LDR	#0
LOOP:	LDX	8000
	CMP	LOWTEMP
	JGE	TEMPOK
	LDD	LOWREG
	OR	COUNTER
	STO	LOWREG
TEMPOK:	LDD	COUNTER
Q1:	CMP	#32
	JPE	HEATON
	ADD	COUNTER
	STO	COUNTER
	INC	IX
	JMP	LOOP
HEATON:	LDD	LOWREG

(i) The code uses six memory locations to store the temperature readings. It stores readings for sensors 1 to 6 at addresses `8000` to `8005`.

At a particular time, the memory locations store the following data.

8000	8001	8002	8003	8004	8005
17	14	15	15	16	14

Dry run the assembly language code starting at `START` and finishing when the loop has been processed twice.

LOWTEMP	LOWREG	COUNTER	ACC	IX
15	B00000000	1		

[4]

(ii) Explain why the operand of the instruction labelled `Q1` has the value 32.

....

....

....

.... [2]

(iii) The code beginning at the instruction labelled `HEATON` must make the system turn on the heaters in those areas that are below the minimum temperature.

Describe what this code will have to do.

....

....

....

....

....

.... [3]
